"Bromination With Dioxane-Dibromide. I. Bromination of Phenols," L. A. Yanovskaya,^A
A. P. Terent'yev, L. I. Belen'kiy, Moscow State U

"Zhur Obshch Khim" Vol 22, No 9, pp 1594-1598

Authors propose a convenient new method for brominating phenols, naphthols, and
oxyanthraquinones in which the addn product of bromine to dioxane, i.e.,
dioxane-dibromide, is used.

BELEN'KIY, L. I.

A new method for the analysis of dithionite. L. I. Belen'kiy and M. E. Karajskaya. *Teziz-Prizy* 9, 89-90 (1954). The method, which is applicable to dyehouse of vat dyes, including those contg. leuco compds., depends on the use of the dye Acid Red 3 (Amaranth, C. I. 184), which in neutral or alk. soln. is reduced to naphthionic acid and amino-R-ackf. while the $\text{Na}_2\text{S}_2\text{O}_4$ is oxidized to NaHSO_4 . A measured amt. of the $\text{Na}_2\text{S}_2\text{O}_4$ soln. is added to a known vol. of a 20 g/l. soln. of the dye, the quantities being so chosen that the dye is in excess. After suitable diln., the unreduced Acid Red is detd. with the photoelectric colorimeter. When leuco vat dyes are present in the soln., it is necessary to filter off the pptd. vat pigments before dilg. and estg. The operations should be carried out within 0.5 hr. to avoid a further reduction by the sulfite present. Details of standardization are given. W. E. Matheson

BELETSKIY L. I.

Control of vat dyeing processes. L. I. Belen'ki and M. E. Karanskaya. (Zh. Tekh. Fiz., 1954, 24, No. 1, p. 26-28). A series of laboratory control methods is described that is based on the use of a photoelectric colorimeter, a device for determining the conductivity, and a pH meter. In conjunction with automatic control and control of the parameters concerned (temp., concn. of solutions, velocity, squeezing, etc.), the methods make possible a rational utilization of dyes and auxiliary materials. Spectrophotometric study of sols of vat and sulfur dyes. *Izv. Akad. Nauk SSSR, Ser. Khim. Nauk*, 1954, No. 1, p. 111. The extinction coefficients in visible (and partly in ultraviolet and infrared) light were detd. for mol. and colloidal sols and suspensions of Vat Blue K, indigo, monobromoindigo, dibromoindigo, Indigo KG, dichlorodibromoindigo, tetrabromoindigo, C.I. 11.4 Blue 2B, Direct Pink 2C, and Direct Blue M. The absorption spectra depended not only on the structure of the mol. but also on the protective colloid present in the sol and, if Na₂S₂O₄ were present, also on the age of the sol. A part of the spectrum was due to the salts in the liquid, such as Na₂SO₄, Na₂SO₃, Na₂S, Na₂S₂O₃, and K₂SO₄. The light scattering by the sols was very small. Beer's law was valid when the concn. changed, e.g., in the ratio 3:1. The formation of indanthrene Bright Green 15B from its leuco compound on shifting the pH from 11.8 to 4.5 could be followed by extinction measurements. The extinction of S dyes varied with time if the liquid contained an excess of H₂O₂. Again a part of the spectrum was due to salts, and Beer's law was valid. Spectra were detd. for Sulfur Black, Sulfur Blue, and Immedial Dark Brown, both dyes and leuco compounds. J. J. Bikerman

TITLE: A Device for Design Calculation of Beams on Flexible Supports on a Continuous Flexible Foundation (Pribor dlya rascheta balok, lezhashchikh na uprugikh oporakh i sploshnom uprugom osnovanii)

PERIODICAL: V sb.: Issledovaniya po teorii sooruzheniy. Nr 7. Moscow, Gosstroyizdat, 1957, pp 575-586

ABSTRACT: Description of a device serving for the mechanical calculation of statically indeterminate beams lying on free flexible supports. The basic idea of the calculation with the aid of this device consists in the following: The original beam is replaced by a similar model; the loads and the coefficient of the rigidity of the supports k_i are simulated; the sagging of the supports f_i is measured, and their reaction is calculated on the basis of measurements thereon by the formula $R_i = k_i f_i$. Then the results obtained from the model beam are extrapolated for the original beam. A continuous flexible foundation can be simulated by the simple device of increasing the number of flexible

TITLE:

Measurement of the Contact-- Stress Between Rollers and Rails
by the Crusher ~~GOST~~ Method

PERIODICAL:

Zavodskaya laboratoriya, 1959, Vol 25, Nr 10, pp 1254 - 1255
(USSR)

ABSTRACT:

A method for the determination of contact stress on rails was worked out, which is based upon the measurement of the flattening of a wire by pressure. An annealed copper wire of the type MM (GOST 2112-46) with a diameter of 1.8-2.2 mm is fastened to the rail (Figure). On the stressed surface of the rail the wire has two windings (in the longitudinal direction of the rail), and is fastened to the lower edge of the rail. The stress, to which the rail surface was subjected, is evaluated according to the extent to which the wire is flattened, because the width of the flattened wire depends linearly on the stress. The method described was used for the purpose of measuring contact stresses between rollers and rails in the case of the launching of ships and agreed well with the weight of the ship (within a difference of 10%). In the case of lower stresses

Collapsible paddings in shipbuilding and ship repair (Sminayushchiyesya prokladki v sudostroyeni i sudoremonte) Leningrad, Izd-vo "Sudostroyeniye", 1966. 130 p. illus., biblioc. 2700 copies printed.

TOPIC TAGS: collapsible padding, shipbuilding engineering, shock absorber

PURPOSE AND COVERAGE: This booklet is intended for engineering and technical staff engaged in the construction and repair of seagoing and river vessels, and in other fields of technology. It can be used by students of higher technical schools and institutes. Utilization of collapsible padding in shipbuilding and shiprepair plants is discussed, and the selection of materials, their mechanical properties, and the design and construction of collapsible paddings are described in detail. There are 52 references, 51 of which are Soviet.

TITLE: Determining the Maximum No-Load Current of Transformers and the Charging Current of 110- and 35-kv Lines Cut by Type RLN Disconnects

PERIODICAL: Naladochnyye i eksperim. raboty ORGRES, Nr 15, 1958, pp 156-163

ABSTRACT: To determine the possibility of adopting the substation schemes without circuit-breakers on the high-voltage side, ORGRES jointly with large power systems (Lenenergo, Mosenergo, and others) staged tests intended to determine maximum currents and thereby maximum power of transformers and also maximum length of a transmission line that could be reliably cut off at no-load by a type RLN disconnecting switch. In addition to visual observations, a cinema filming was made which permitted determining the duration of arcing; to determine accurately the moment of arc extinction in relation to the angle of the disconnecting blades, both the current being interrupted and the blade

Card 1/2

SOV/112-59-5-8849

Determining the Maximum No-Load Current of Transformers and the Charging
movement were recorded by an oscillograph. Overvoltages set up by cutting off
no-load lines were not measured. The tests enable one to draw the following
conclusions: The voltage, maximum transformer capacity, and transmission-
line length which could be cut off at no-load can be considerably increased over
those specified by the PTE MES standards. No-load currents as high as 7 amp
for 20-Mva, 38-kv transformers and 10 amp for 31.5-Mva, 110-kv
transformers can be cut off by a RLN disconnect. It is recommended that the
disconnects be operated on or off quickly. Pole separation of the disconnect
should not be less than 2,500 mm for 110 kv and 1,200 mm for 35 kv. To
determine the maximum no-load length of 35- and 110-kv lines that could be
cut off by the disconnect, overvoltages accompanying the line interruption need
to be studied.

TITLE: Elimination of pitting in bright nickel-plating electrolytes

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy, Khimiya i khimicheskaya tekhnologiya, v. 5, no. 6, 1962, 951 - 953

TEXT: An attempt was made to eliminate pitting during bright nickel-plating by additions of surface-active materials to the electrolyte. Twelve phosphoro-organic compounds were prepared by the interaction of various alcohols with phosphorous pentoxide. Similar sulphur-organic compounds were also prepared by the interaction of secondary higher aliphatic alcohols with sulfuric acid. Sodium salts of the compounds were made and tested as additives to the electrolyte. It was shown that the sodium salts of mono- and di-heptyl esters of phosphoric acid prevented pitting only in a short interval of concentration of the order of 0.015 g/l. Pitting occurred if the concentration was increased. Additions of
Card 1/2

Elimination of pitting

S/153/62/005/006/008/015

secondary alkyl sulfates of sodium prevented the occurrence of pitting. The surface tension of the bright nickel electrolyte, consisting of nickel sulfate 250-300, sodium chloride 10-15, boric acid 35, coumarine 1 and paratoluene sulfamide 2 g/l., was 70 dynes/cm. Addition of 0.1 g/l. sodium alkylsulfates decreased the surface tension to 30 dynes/cm. Addition of sodium alkylsulfates made possible the production of bright nickel coatings not requiring polishing and without pitting. It was recommended that a daily correction to the electrolyte of 0.1 ml./l. anti-pitting agent should be used to maintain stable working of the bath.

"Analysis of the Action of Cyanides on the Respiration of Frogs," M. L. Belen'kiy, Chair of Pharmacology, Second Leningrad Med Inst, 6 pp

"Fiziol Zhur SSSR" Vol XXXIV, No 1

Discusses the role of the carotid body in frogs. Author conducted experiments based on data previously obtained by Prof S. V. Anichkov. Observed that the carotid body in frogs do not play any part in maintaining respiration after potassium cyanide had been introduced, and the body does not carry out the same functions as the carotid glands in mammals. Submitted, 18 Jun 1946.

Effect of adenosinetriphosphate acids on chemical sensitivity of the carotid ganglion. M. I. Belen'kii (Sanit.-Hyg. Med. Inst., Leningrad). *Doklady Akad. Nauk S.S.S.R.* 76, 305-8 (1961).—The so-called Pasteur poisons, i.e. substances that do not affect O consumption by the cell but disrupt phosphorylation connected with it, are stimulants of the carotid chemoreceptor centers. This suggests the possible mechanism of origin of the excitation within the carotid as being connected with metabolism of high-energy phosphate links. The effect of adenosine triphosphate (ATP) on sensitivity of the carotid centers to KCN, acetylcholine, and lactic acid was studied on cat specimens. ATP was found to stimulate these centers as shown by respiration measurements, the effect becoming apparent not during perfusion with ATP but at the time when the energy balance in the carotid is disturbed by prevalence of decompu. of ATP over its synthesis, indicating that the decompu. of

ATP is the factual stimulating event. Results show that lactic acid as such is not the stimulant of the carotid centers.

The question of the mechanism of excitation of the carotid chemoreceptors. M. Beien'kii (Sanit. Hyg. Med. Inst., Leningrad). *Fiziol. Zhur.* 37, 169-74(1951); *Chem. Zentr.* 1952, 247. —The expts. reported were carried out on decerebrated cats by the method of Moiseev, Gelfmans, and Anichikov. Perfusion of the isolated carotid sinus with 1:10,000 $\text{CH}_3\text{CO}_2\text{Na}$ (I) soln. caused a loss of sensitivity of the chemoreceptors for CN^- and for lactic acid (II), while the reactivity for acetylcholine (III) remained unchanged. After perfusion of the carotid sinus with a 1:5,000 I soln. or with NaF solns. of concn. 1:50,000 and 1:25,000, the carotid chemoreceptors no longer reacted to CN^- , II, or III. As regards the influence of enzyme poisons on the region of the carotid sinus, the resistance of the chemoreceptors against II is no greater than that against CN^- . It is not to be assumed that the direct excitation of the sinus nerve is brought about by II formed in the tissue. M. G. Moore

✓ Chemical sensitivity of chemoreceptors. M. L. Belenkijs. *Farmakol. Novyykh Lekarstvennykh Sredstv* (Mediciz. Leningrad) 1953, 116-21; *Referat. Zhur., Khim.* 1954, No. 23878. -- A review of the pharmacol. studies of the biochem. processes assocd. with the activity of the chem. receptors of the carotid body (I). Elimination of the biochem. decoupling of the tissue carbohydrates inhibits the reaction of I toward the actions of CN^- , acetylcholine, and decreasing of pH. The hypothesis that this phenomenon is assocd. with an inadequate formation of adenosinetriphosphate (ATP) has been confirmed. By making use of the isolated carotid sinus of a cat it was shown that ATP either has no effect on I or it stimulates I step-by-step; however, after perfusion of ATP the sensitivity of I towards the stimulants increases, thus indicating ATP as the source of energy. It is further proved that a prerequisite for the origination of the sensitivity of I is the neg. balance of ATP. The sensitivity of I can also be induced by those substances disrupting the phosphorylation coupled with the biol. oxidation (azide, nitrite, 2,4-dinitrophenol, methylene blue). It is possible that acetylcholine also stimulates I by shifting its energy balance to the neg. side. It is concluded that the primary function of I is to signal the central nervous system about the neg. shift of the energy balance in a tissue, and that this physiol. reaction initiates the reflex reactions stimulating the formation of high-energy P compounds. TITLE: Mechanism of increasing the activity of certain blood serum enzymes with strong stressors

SOURCE: Voprosy* meditsinskoy khimii, v. 10, no. 1, 1964, 12-15

TOPIC TAGS: increased enzyme activity mechanism, blood serum enzyme, glutamin pyruvic transminase, glutamin oxalacetic acid, aldolase, stressor, tissue enzyme

ABSTRACT: Activity of glutamin pyruvic transminase, glutamin oxalacetic acid, and aldolase was investigated in groups of white rats subjected to the following stressors: hypoxia, asphyxia, hypothermia, inflammation, burn shock, seizures, and septicemia. Blood of animals was centrifuged after completion of experiments and enzyme activity was determined in the serum and liver, heart, and brain tissue homogenates. Findings indicate that the activity of glutamin pyruvic transminase, glutamin oxalacetic acid, and aldolase changes in the blood serum and tissues under the action of strong stressors. Most

Card: 1/2

ACCESSION NR: AP4022336

stressors (hypoxia, hypothermia, burn shock, nonspecific inflammation, and septicemia) increase enzyme activity in the blood serum and tissues. Conditions contributing to the development of acidosis (asphyxia by placing animal in a refrigerator) prevent an increase of blood serum enzyme activity. Various organs and tissues regardless of whether they are directly affected by the stressor can be sources of increased enzymes. No constant correlation is found between increased activity of blood serum enzymes and tissue enzymes. Orig. art. has: 1 table.

TITLE: Promising new directions for pharmacological regulation of activity of the cardiovascular system

SOURCE: AMN SSSR. Vestnik, no. 4, 1966, 54-59

TOPIC TAGS: pharmacology, central nervous system, nervous system drug, cardiovascular system disease, enzyme, experiment animal

ABSTRACT: With a view towards blocking the untoward activity of pyrocatechin-O-methyltransferase (POMT), the effect of the alkaloid apomorphine and of synthetic compounds on adrenergic processes was investigated. Tests were conducted in cats, priorily treated with an excess of epinephrine, whose urine was analyzed for 3-methoxy-4-oxymandelic acid. Under the influence of apomorphine, a statistically valid decrease in elimination of this acid was seen. This fact confirms an assumption on the inhibitory effect of apomorphine on POMT activity. Decrease of pyrocatechamine inactivation by the apomorphine effect was also confirmed in cats in whom increased pressor reactions were seen.

upon introduction of norepinephrine or epinephrine. Apomorphine also showed presynaptic adrenoblocking action revealed in weakening of the contraction reaction of the nictitating membrane of cats' eyes upon irritation of the neck sympathetic trunk; simultaneously, this reaction was strengthened with epinephrine. At very high doses (30 mg/kg) apomorphine also showed a post-synaptic adrenolytic effect. A series of ternary ammonium pyrocatechinamines was synthesized and did not prove too active. Another series, synthesized at the Riga Institute's Laboratory for Problems of Diketones, had the general formula

where $\text{NRR}'\text{R}''$ were trialkylammonium, arylalkyldialkylammonium or alkyldiarylalkylammonium groups. These compounds showed strong adenosensitizing properties and, as quaternary ammoniums, also ganglion-blocking properties, although the latter were weak and short lived. One of the compounds, F-3, showed an adenosensitizing effect independent of ganglion-blocking properties. It strengthened the effect of electric irritation of the adrenergic nerves. Results show that modern concepts on mechanisms of pyrocatechin inactivation in the organism may open new paths for drugs which increase adrenergic

ABSTRACT: Comparisons are made of operational indexes of steam and diesel traction, and of the indexes for different types of diesel traction. Considerable reduction of expense was obtained in all kinds of repair of diesels. In comparison with the steam locomotives the reduction was 50% and in comparison with the ~~other~~ locomotives - 30%. The expenditures for fueling diesels per unit of work by weight and cost were 4 - 5 times lower than that of steam locomotives. The TЭ-2 diesels were found to be more economical than the TЭ-1 diesels.
